

System Maintenance

Prevents Blocked Drippers and Build-up in Hydroponics, Coco and Soil Systems

- **Prevents the blockage of drippers, pipes, pumps and filters** — Helps stop white deposits from forming in the nutrient solution, even when carbohydrates or sugary additives are used. These can block dripper systems (and pipes) and are time-consuming to remove
 - **100% organic formulation that enables growers to grow 'organically' without the usual drawbacks** —will NOT harm valuable organic additives such as resin/root enhancers, bloom boosters, enzymes, myco's and beneficial bacteria. Chlorines and peroxides found in competing products will destroy these types of additives and render them useless
 - **Serves as a cleaner for tools and system hardware**— use during post harvest clean-up
 - Dosage: 1-2ml/L (4-8ml/Gal) from seed to harvest.
- NOTE: If heavy buildup, use at 2ml/L
- Available in: 1L // 5L // 20L // 1000L

Sample of Aug 19 VegaFlora test batch with all FloraMax additives and **System Maintenance**. Despite being exposed to ambient light for 19-months there is still no sign of white deposits - @floramaxlab

TESTIMONIALS

“When the day temperatures rise we get white deposits forming in the reservoir. This stuff goes through our system blocking pumps, drippers and pipes... System Maintenance has stopped this from happening, which has saved us A LOT of unnecessary maintenance and guaranteed our plants are getting watered on time.” ”
